**LANCER SYSTEMS DOUBLES DOWN ON SOLDIER SAFETY***Lancer's new L5AWM® Safety Magazine provides multiple life-saving features for non-lethal training.*

**Quakertown, PA** – The job of a military service member or law enforcement officer is difficult enough without having to worry about being injured during a routine training exercise. That concern, however, is well-founded based upon the frequency and severity of incidents that occur during simulated combat training. The majority of these injuries – and even deaths – are the result of live ammunition being accidentally introduced into the training environment.

Until recently, training exercises involving blank ammunition or non-lethal marking ammunition still required the use of standard rifle magazines. These magazines can be easily mixed up with magazines containing live ammunition; the results of which can, and do, prove deadly.

Lancer Systems takes soldier safety very seriously and is proud to announce the official launch of their L5AWM® Safety Magazine. These new Safety Magazines are specifically designed with a number of safety features not currently available in any other training magazine, including an updated internal geometry that inhibits even a single round of standard live ammunition from being loading into a rifle. Additionally, the translucent magazine body provides instant visual confirmation of ammunition type and round count, allowing instructors and trainees alike to have complete confidence during training exercises.

Lancer's L5AWM Safety Magazines are compatible with most M4-pattern weapon platforms chambered in 5.56mm NATO and have been extensively tested and proven to be reliable with non-lethal cartridges from Simunition®, Force on Force™, and standard 5.56mm blanks.
