

March 14th, 2014

Per the CRC BOD, member owned steel may be placed on the high power range berm. Generally, the steel must be placed so that it is above the elevation of the pits as seen from the firing position(s) and so that ALL bullets land on the earthen berm in the impact zone. The blue outline would generally define where steel can be placed and where bullets must impact.

The red outline (smaller and to the right) is the area where option 1 will likely be placed.
